

Iter-36: first-principles $\theta_{\text{chir}}(N)$ running, higher- N predictions, and D_Ω resonance

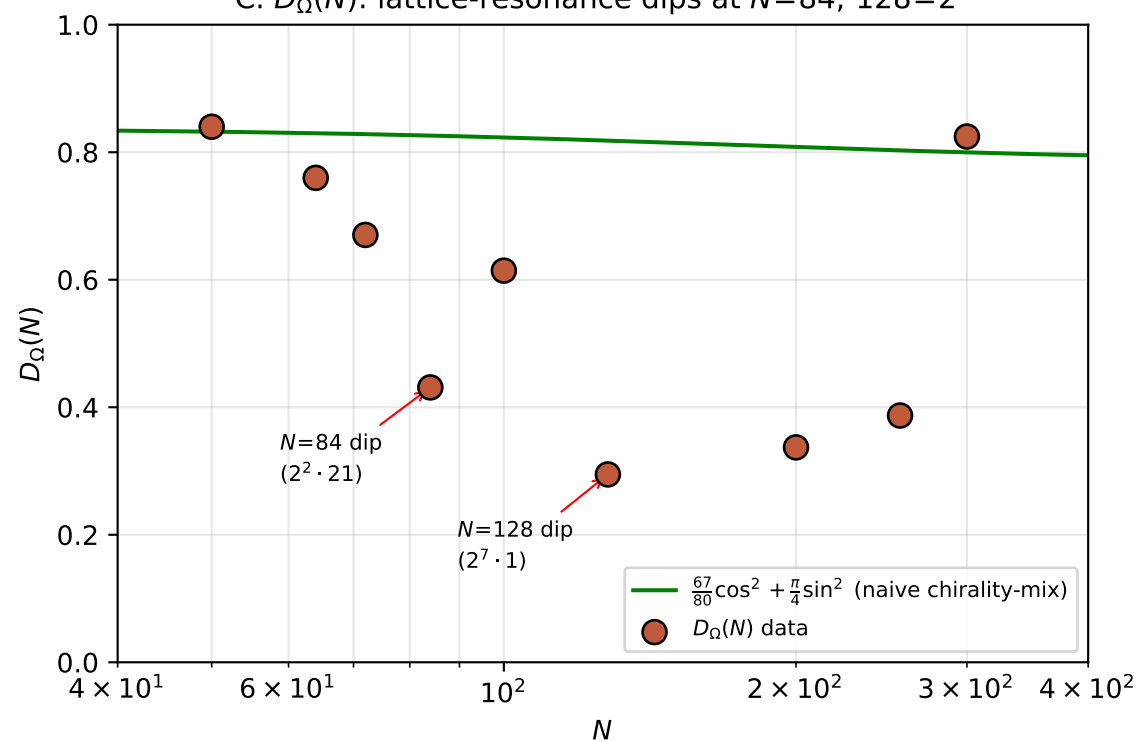

A. First-principles $\theta_{\text{chir}}(N)$ running + p95 CI

B. Higher- N predictions: α_ξ , β_π to $N=2000$

C. $D_\Omega(N)$: lattice-resonance dips at $N=84, 128=2^7$

D. α_ξ/β_π exponent bootstrap (target $-2/5$ inside p95: YES)
