

POST-flip layer hierarchy on $C^{(p)} = \{\Delta_a > a_p\}$: five diagnostics, slaving- K identification, ρ -anti-coherence

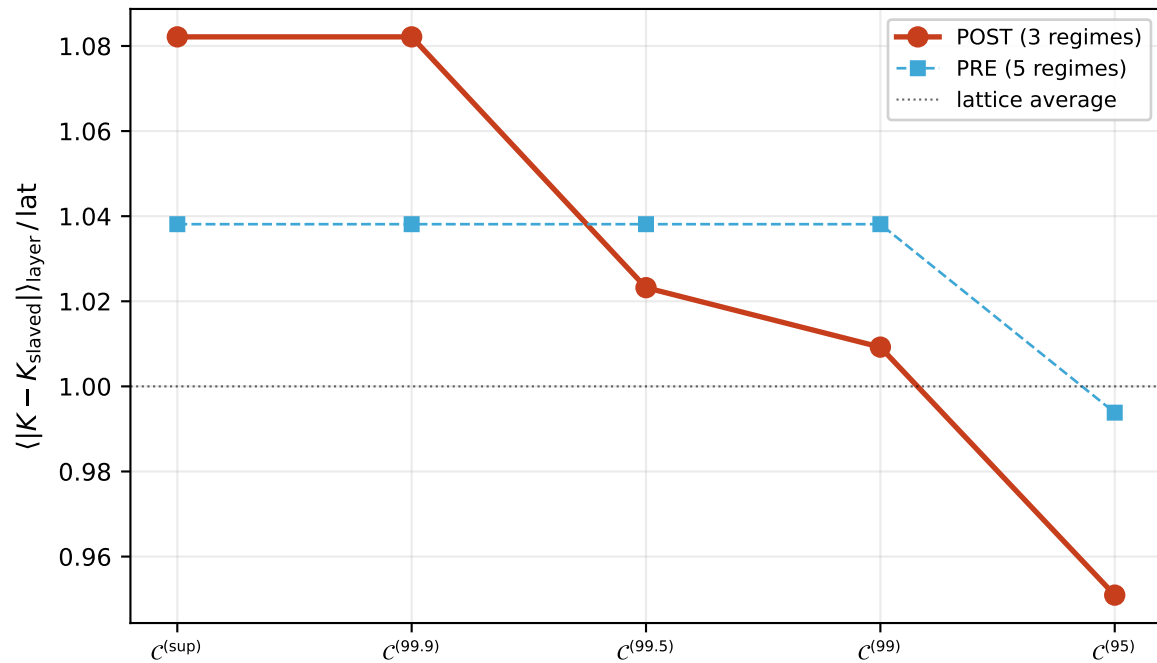

(A) Five diagnostics across shell rank n , PRE (dashed) vs POST (solid)

(B) $|\Delta\rho|$ vs candidate n -scalings: $1/\sqrt{n}$ best fit

(C) Slaving- K residual ratio per layer (unslavedness)

(D) Per-regime curves: PRE (dashed blue) vs POST (solid red)
